 - Multi-Level Links & Nested Pages (Parking Document) The main parking page does not provide all the steps to pay a ticket or file an appeal all in one place. It links to other pages outside of forms and the student accounts portal.
 - Impact: Our chatbot can't scrape the top level URL. The ingestion tool has to follow child links and pull from attached PDFs so it gives actual answers instead of sending students through another loop of links.
 - HTML Tables (Academic Schedule): Complex HTML tables are used for multiple terms (Fall, Spring, Summer) to display deadlines, drop/add dates and refund percentages.
 - Impact: A standard text splitter will split rows and columns and scramble dates and deadlines. We need a parser that preserves table rows (e.g. Markdown tables) and has a check for current dates, so the bot doesn't quote a late deadline.
 - Fragmented Course Data & Prerequisites (Academic Catalog): The course prerequisites and semester offerings are separated into pop-ups, expandable boxes, and campus tags (Hammond vs. Westville).
 - Impact: The bot needs to combine prerequisites into a single clear summary. That also includes the chatbot asking students what campus they are attending before taking questions about course availability.

<https://www.pnw.edu/accessibility-at-purdue-university-northwest/>

<https://www.pnw.edu/dean-of-students/policies/academic-integrity-policy/>

Graduates policy is fairly simple so an AI might not have too much trouble, but there are a lot of links that lead to certain parts of the document that might make it revert back to previously stated information. The second thing of note is there are a lot of designs like the star and share button that are not needed but are included in the design of the document policy that may affect the AI.

Accessibility policies is full of links and buttons that redirect a user to information while also having images and boxes with text that are in different sections from the main page as well as repeating links depending on where you click to access the data for more information. The site itself has little to no information unless you select the button so this might make it hard for an AI to provide the correct information.

Academic Integrity policies site should be good for an AI to collect data from. It may have trouble accessing the data hidden behind the button and the table, but overall most data is in a listed format that should be easy for the Chatbot to read and record the information about Academic Integrity.

ANALYSIS OF DOCUMENTS:

1.) PNW Student Handbook:

The PNW Student Handbook is a PDF document that contains information directly related to students. It includes information about student responsibilities, academic misconduct, university rules, and expected student behavior. The information is organized into different sections, which makes it easier for students to find specific topics. One benefit of this format is that most of the information is contained in one document. However, students may need to search through the PDF to find a specific rule or topic. The PDF search feature can make this process easier. The handbook also refers students to other university policies and resources, so they may sometimes need to follow a link or look at another source for more information.

2.) Classroom behavior policy:

The Classroom Behavior Policy is also a PDF. The information is organized using headings, definitions, and numbered sections. This makes it easier to understand the different rules and expectations. One benefit of this format is that most of the policy is contained in one document. However, someone looking for a specific rule still has to open the PDF and search through the document. Using the PDF search feature makes finding specific information easier.

3.) Information Services Policy:

The Information Services Policies document is an HTML webpage. Instead of putting all of the information into one PDF, the website uses webpages and links to organize the policies. This can make information easier to access because users can click on different links to find the policy they need. However, it can also make finding information more complicated because the user may have to go through multiple webpages or links before finding the exact information.

CONCLUSION:

The three PNW documents show how the format and organization of information can affect how easily students and users can find the information they need. The PNW Student Handbook and Classroom Behavior Policy are both PDF documents. They organize information into sections and headings, which helps users find specific topics, although they may need to search through the PDF to locate certain information. The Information Services Policies document is an HTML webpage that uses links to organize different policies. This makes it possible to navigate directly to different resources, but users may need to click through multiple pages to find specific information.

Overall, the three documents show that different formats have different advantages and disadvantages. PDFs are useful because they keep a large amount of information together in one document, while HTML webpages can make navigation between different resources easier. The way information is organized can therefore affect how quickly and easily students can access the policies and information they need.
